

## Visual characteristics of the glass

When your glass changes from one tint level to another, it will exhibit a “theater curtain” effect during the transition; the transition begins along the long edges of the glass and gradually moves toward the center. Once the transition is complete the glass will be uniform.

The time it takes for a Dynamic Glass window to change between tint levels depends on the size of the glass, ranging from 10 minutes for smaller glass and up to 30 minutes for larger glass.

## Four tint states

View Dynamic Glass has four levels of tint which you can control to improve comfort in a room. The levels can be set through a Wall Switch, an App on your iPhone or Android device, a pre-determined schedule and a fully-automated Intelligence mode.
